**AwwaRF : Non-Uniform Corrosion in Copper Piping-Assessment** before purchasing it in order to gage whether or not it would be worth my time, and all praised Non-Uniform Corrosion in Copper Piping-Assessment:

This project was organized in two distinct phases of work. In the first phase, the extent of pinhole leaks and their associated costs were assessed nationally. The goal of the second phase was to identify mechanisms causing pinhole leaks by conducting intensive sampling site visits at participating communities. A case study was developed for each site visit and community. Due to the photographic intensive nature of the case studies, they are published in a CD-

ROM attached to this report.
